Museum Registered Authority

Mr Maguinness

A micropalaeontological examination of the diatomite from Glengower revealed the following assemblage of diatoms:

Melosira cf. granulata (common)
Synedra ulna (broken frustules common)
Small Navicula (common)
Epithema cf. turgida (few)
Eunotia major (few)
Cymbella heliopleura (few)
Rhopalodia ventricosa (few)
Stauroneis phonenicentron (few)
Gomphonema intricatum (few)
Tabellaria (rare)

A few sponge spicules were also present.

The above assemblage of diatoms is similar to that found in the diatomite from Newham.

Reg No 11767 (P Crohn)

Sample forwarded to Mr J. Crohn Canberra 19/9/58
